Art Unit: 2183

DETAILED ACTION

1. Claims 1-19 have been examined.

Papers Submitted

2. It is hereby acknowledged that the following papers have been received and placed of record in the file: RCE and Amendment as received on 10/20/2004.

Specification

3. The title of the invention is not descriptive. A new title is required that is clearly indicative of the invention to which the claims are directed.

Response to Arguments

4. Applicant's amendment filed on October 20, 2004, have overcome the rejections set forth by the examiner in the previous Office Action. However, upon further consideration, an alternate embodiment of Swoboda anticipates applicant's claims, and consequently, rejections under Swoboda are applied below.

Claim Rejections - 35 USC § 102

5. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an

international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

- 6. Claims 1, 5, 7, 14, and 18 are rejected under 35 U.S.C. 102(e) as being anticipated by Swoboda et al., U.S. Patent No. 6,643,803 (herein referred to as Swoboda).
- 7. Referring to claim 1, Swoboda has taught a method for testing a processor including an execution stage comprising:
- a) generating a neutral instruction that causes, when executed, an architectural state value for said processor to be ascertained. See the abstract and claims 1 and 2. Note that the jammed instruction is the generated neutral instruction. And, the instruction is neutral because a resource can be read as a result of the instruction. A read of a resource does not modify the architectural state of the processor, and therefore, a read is a neutral instruction.
- b) providing said neutral instruction to the execution stage of said processor. From the last paragraph of claim 1, it can be seen that the neutral instruction is jammed into a bubble of the instruction pipeline, which is part of the processor according to the claim (note also that ever component listed in claim 1 is part of the processor). Consequently, it is executed by the processor.
- c) executing said neutral instruction to ascertain said architectural state value. Again, from the abstract and claims 1 and 2, upon execution of the neutral instruction, system resources are read. These system resources include registers (column 2, lines 50-51). Since registers hold values, these instructions would ascertain (read) values for the processor.
- 8. Referring to claim 5, Swoboda has taught a method as described in claim 1. Swoboda has further taught that the execution of said neutral instruction causes said processor to access a value stored in a register in said processor. From the abstract it is disclosed that system

resources, which include registers (column 2, lines 50-51), are read when a neutral instruction is executed.

- 9. Referring to claim 7, Swoboda has taught a system for testing a processor including an execution stage, comprising comparison logic coupled to the execution stage of said processor, wherein said execution stage is to execute a neutral instruction that is to cause, when executed, an architectural state value for said processor to be ascertained. From the abstract and claims 1 and 2, upon execution of neutral instructions (those which result in a reading system resources), system resources are read (note the neutral is executed by the processor because the instruction is jammed into the instruction pipeline, which is part of the processor according to claim 1). These system resources include registers (column 2, lines 50-51). Since registers hold values, these instructions would ascertain (read) values for the processor. In addition, it should be realized that these instructions are used for testing purposes, as described in column 2, lines 46-65. Therefore, for a test to occur, comparison logic must inherently exist in order to determine whether the test was a failure or success. There must be an expected outcome of some sorts which would be compared with the outcome obtained from executing the neutral instruction.
- 10. Referring to claim 14, Swoboda has taught a set of instructions residing in a storage medium (Fig. 12, and note the instruction memory on the far left "INST MEM"), said set of instructions capable of being executed in an execution stage by a processor for implementing a method to test the processor, the method comprising:
- a) generating a neutral instruction that causes, when executed, an architectural state value for said processor to be ascertained. See the abstract and claims 1 and 2. Note that the jammed instruction is the generated neutral instruction. And, the instruction is neutral because a resource

Art Unit: 2183

can be read as a result of the instruction. A read of a resource does not modify the architectural state of the processor, and therefore, a read is a neutral instruction.

Page 5

- b) providing said neutral instruction to the execution stage of said processor. From the last paragraph of claim 1, it can be seen that the neutral instruction is jammed into a bubble of the instruction pipeline, which is part of the processor according to the claim (note also that ever component listed in claim 1 is part of the processor). Consequently, it is executed by the processor.
- c) executing said neutral instruction to ascertain said architectural state value. Again, from the abstract and claims 1 and 2, upon execution of the neutral instruction, system resources are read. These system resources include registers (column 2, lines 50-51). Since registers hold values, these instructions would ascertain (read) values for the processor.
- 11. Referring to claim 18, Swoboda has taught a set of instructions as described in claim 14. Furthermore, claim 18 is rejected for the same reasons set forth in the rejection of claim 5.

Claim Rejections - 35 USC § 103

- 12. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 13. Claims 2, 8, and 15 are rejected under 35 U.S.C. 103(a) as being unpatentable over Swoboda, as applied above, in view of Sato, U.S. Patent No. 5,903,768.

- 14. Referring to claim 2, Swoboda has taught a method as described in claim 1. Swoboda has not taught that said neutral instruction is generated when a plurality of instructions are generated by a compiler. However, Sato has taught such a concept. More specifically, in column 2, lines 4-13, Sato discloses that a compiler is used to generate instructions and the order in which they are executed. Furthermore, when a hazard between two instructions cannot be eliminated, the compiler inserts a NOP instruction between them to overcome the hazard. This is equivalent to generating a neutral instruction because the neutral instruction is the same as a NOP in the sense that it does not affect the architectural state of the processor. As a result, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify Swoboda in view of Sato such that a neutral instruction is generated when a plurality of instructions are generated by the compiler. This would be obvious because Sato has taught the known concept of overcoming a hazard by generating NOPs (or neutral instructions), and hazards must be overcome in order to prevent data corruption.
- 15. Referring to claim 8, Swoboda has taught a system as described in claim 7. Furthermore, claim 8 is rejected for the same reasons set forth in claim 2.
- 16. Referring to claim 15, Swoboda has taught a set of instructions as described in claim 14. Furthermore, claim 15 is rejected for the same reasons set forth in claim 2.
- 17. Claims 3-4, 6, 9-11, 16-17, and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Swoboda, as applied above, in view of Mandyam et al., U.S. Patent No. 6,285,974 (herein referred to as Mandyam).

Art Unit: 2183

18. Referring to claim 3, Swoboda has taught a method as described in claim 1. Swoboda has not taught that said neutral instruction is generated by a No-operation (NOP) pseudo-random generator. However, Mandyam has taught generating test instructions using a random test generator. A person of ordinary skill in the art would have recognized that by implementing a random generator to generate instructions, sources of bias are eliminated. Consequently, truly random instructions may be generated which would allow for the possibility of testing any register at any appropriate point within the execution. As a result, in order to perform random testing, as opposed to biased testing, it would have been obvious to one of ordinary skill in the art at the time of the invention to modify Swoboda in view of Mandyam such that a No-operation (neutral instruction) pseudo-random generator is used to generate neutral instructions.

Page 7

- 19. Referring to claim 4, Swoboda in view of Mandyam has taught a method as described in claim 3. Swoboda has further taught that the execution of said neutral instruction causes said processor to access a value stored in a register in said processor. From the abstract it is disclosed that system resources, which include registers (column 2, lines 50-51), are read when a neutral instruction is executed.
- 20. Referring to claim 6, Swoboda has taught a method as described in claim 1. Swoboda has not taught that said neutral instruction is generated by a post-processor device. However, Mandyam has taught such a concept. See Fig.3 and column 6, lines 10-14. Note that a postprocessor is used to generate instructions which are used to perform a self-check. This allows for detection of architectural violations as described in column 6, lines 10-25. Since Mandyam has taught that test instructions may be generated by a post-processor, it would have been

Art Unit: 2183

obvious to one of ordinary skill in the art at the time of the invention to implement a postprocessor in Swoboda for such a purpose.

2·1. Referring to claim 9, Swoboda has taught a system as described in claim 7. Furthermore, claim 9 is rejected for the same reasons set forth in the rejection of claim 3.

Page 8

- 22. Referring to claim 10, Swoboda in view of Mandyam has taught a system as described in claim 9. Furthermore, claim 10 is rejected for the same reasons set forth in the rejection of claim 4.
- 23. Referring to claim 11, Swoboda in view of Mandyam has taught a system as described in claim 10. Swoboda in view of Mandyam has not taught that said neutral instruction includes ORing the contents of said register with itself. However, an OR operation is well known and expected in the art. And, it is known that ORing an operand with itself is a neutral operation as ORing 0 and 0 yields 0 and ORing 1 and 1 yields 1. Since an OR operation is a fundamental logic operation, it would have been obvious to one of ordinary skill in the art at the time of the invention to implement the function of ORing the contents of a register with itself
- 24. Referring to claim 16, Swoboda has taught a set of instructions as described in claim 14. Furthermore, claim 16 is rejected for the same reasons set forth in the rejection of claim 3.
- 25. Referring to claim 17, Swoboda in view of Mandyam has taught a set of instructions as described in claim 16. Furthermore, claim 17 is rejected for the same reasons set forth in the rejection of claim 4.
- 26. Referring to claim 19, Swoboda has taught a set of instructions as described in claim 14. Furthermore, claim 19 is rejected for the same reasons set forth in the rejection of claim 6.

- 27. Claims 12-13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Swoboda in view of Mandyam, as applied above, in view of Hennessy and Patterson, Computer Organization and Design, 2nd Edition, 1998 (herein referred to as Hennessy).
- 28. Referring to claim 12, Swoboda in view of Mandyam has taught a system as described in claim 10. Swoboda in view of Mandyam has not taught that said neutral instruction includes ANDing the contents of said register with all binary 1 values. However, an AND operation is well known and expected in the art, and supported by Hennessy. See pages 225-226. Hennessy has taught that each resulting bit will be 1 only if both corresponding operand bits are 1. And, an operand of an AND operation can be an operand of all 0's, an operand of all 1's, and everything in between. Masking (ANDing operation) is used to isolate fields, which in turn allows for the examination of bits within a word. Consequently, since an AND operation is a fundamental logic operation, it would have been obvious to one of ordinary skill in the art at the time of the invention to implement the function of ANDing the contents of a register with all binary 1 values, as taught by Hennessy.
- Referring to claim 13, Swoboda in view of Mandyam has taught a system as described in claim 10. Swoboda in view of Mandyam has not taught that said neutral instruction includes ORing the contents of said register with all binary 0 values. However, an OR operation is well known and expected in the art, and supported by Hennessy. See pages 225 and 227. Hennessy has taught that each resulting bit will be 1 if either one of the corresponding operand bits are 1. And, an operand of an OR operation can be an operand of all 0's, an operand of all 1's, and everything in between. Consequently, since an OR operation is a fundamental logic operation, it would have been obvious to one of ordinary skill in the art at the time of the invention to

Art Unit: 2183

implement the function of ORing the contents of a register with all binary 0 values, as taught by

Hennessy.

Conclusion

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to David J. Huisman whose telephone number is (571) 272-4168.

The examiner can normally be reached on Monday-Friday (8:00-4:30).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Eddie Chan can be reached on (571) 272-4162. The fax phone number for the

organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR

system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR

system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
